

DelLeft v2.0 for Win32

Program Description	<p>DelLeft is a Win32 version of the older DelDrive that has one simple usage – it accepts text from stdin, removes the first “n” characters from each line, and echos the text to stdout.</p> <p>This program allows you to easily build file lists for NetWare servers by first running a DIR /S /B command, then running DelDrive to remove the drive letter, and then use MakeBat to add the volume name at the beginning of each file. It can also be used for a myriad of other scripting purposes.</p>
Platform and Package	Win32; Goldstar Utility & Management Package
Pricing	FREE Tool
Command Line Syntax and Help Screen	<p>DelLeft Version 2.0: 10/16 (C)2007 Goldstar Software Inc. FREE Tool! Get more from http://www.GoldstarSoftware.com.</p> <p>Usage: DELLEFT n This utility reads an ASCII file from stdin, removes the first "n" characters, and sends the results to stdout.
